WHAT IS JAVA?

- It is an Object-Oriented Programming Language developed by Sun Microsystems and released in the year 1995.
- Platform independent(i.e. , it can run on any platform).
- Mainly based on the OOPS concept(Object Oriented Programming Systems).
- It can be combined with other technologies like Spring , Hadoop and Android.

Dharmamurthi Rao Bahadur
Calavala Cunnan Chetty's Hindu College (Shift 2)
Dharmamurthi Nagar,
Pattabiram, Chennai-600072.

WHY JAVA?

Scalability:

- We can achieve scalability by increasing the resources such as RAM and CPU in a single system.

Memory – Management:

- Java provides its own mechanism for managing the memory is known as garbage collection.
- It automatically deletes the objects when they no longer used by the application. It improves the speed of the application.

Pattabiram, Chennai-600072.

CORE JAVA CONCEPTS

Java Variables :

- VARIABLES ARE USED TO STORE VALUES.
- VARIABLE TYPES DETERMINE THE MEMORY REQUIRED TO STORE THAT VARIABLE.

Dharmamurthi Rao Bahadur
Calavala Cunnan Chetty's Hindu College (Shift 2)
Dharmamurthi Nagar,
Pattabiram, Chennai-600072.

COMPONENTS OF JAVA

- JVM: It provides an environment for executing Java Programs.
- JDK: It is a software development environment and it contains the compiler , debugger and other classes to compile and debug a software program.
- JRE: It provides a runtime environment to execute the Java programs and other applications.

Pattabiram, Chennai-600072.

Java Identifiers

Variable names must be a unique name.

Unique names are called identifiers. Identifiers can be small names(like a and b) or some other name which provides information about what that variable contains.

Consider the following example

```
int totalSum = 60;
String color = "Red"
```

Dharmamurthi Rao Bahadur
Calavala Cunnan Chetty's Hindu College (Shift-I)
Pattabiram, Chennai-600072.

Data Types in Java

Consider the following example

```
int num1 = 10; // Integer (whole number)
float numFloat = 10.55f; // Floating point number
char firstCh = 'R'; //
Character boolean firstBl = true; // Boolean
String firstTxt = "Hello"; // String
```

There are two different Data types in Java

Primitive data types - byte, short, int, long, float, double, boolean and char

Non-primitive data types – String , arrays and classes come under non-primitive datatype

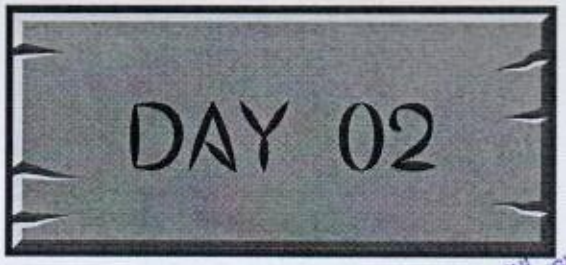
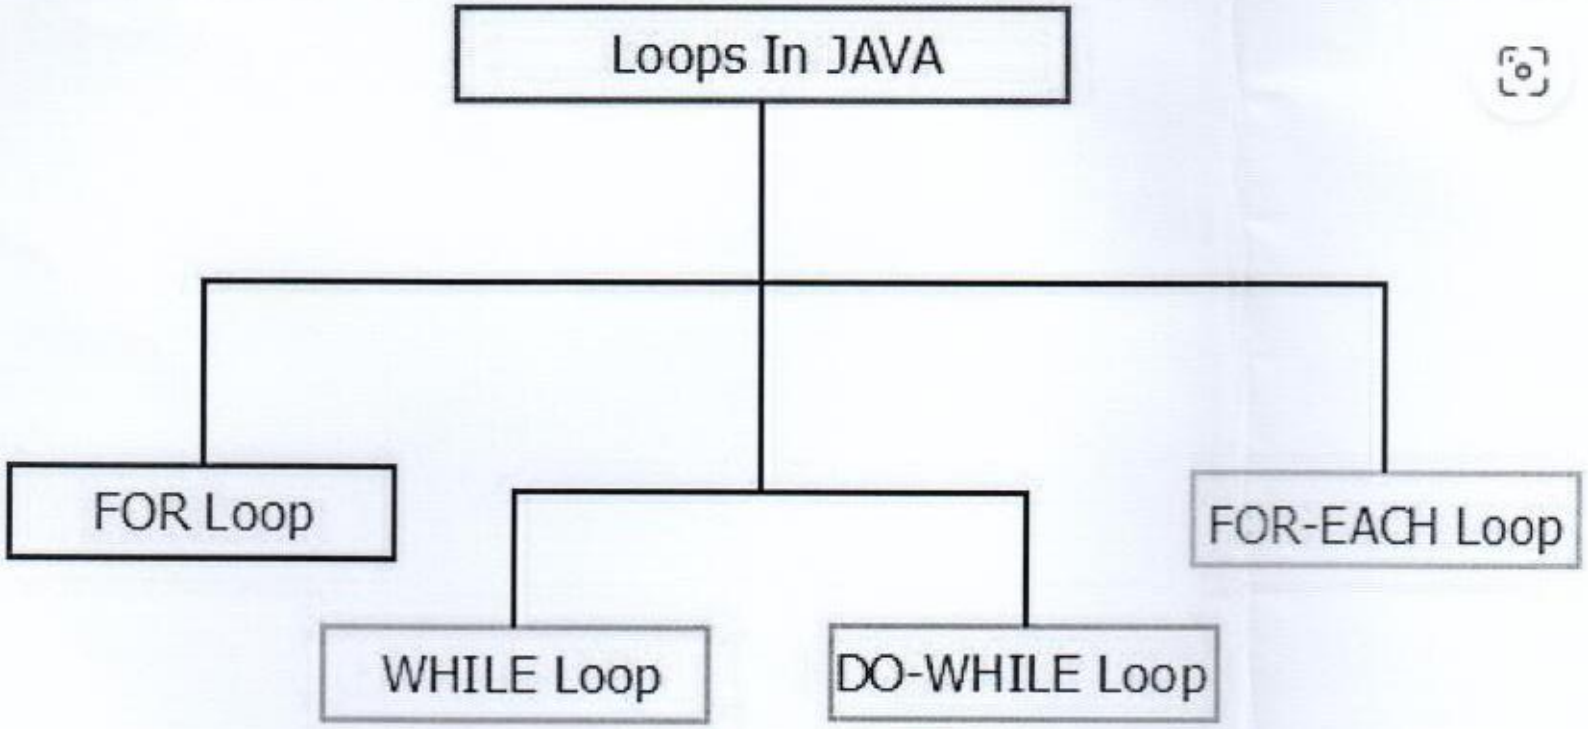
Loops, Decision-Making statements, arrays, and methods in Java



Loop

- When a set of statements is executed number of times, then it is called as a loop statement.



Loops In Java : Types

Dharmamurthi Rao Bahadur Calavala Cunnan Chetty's Hindu College (Shift 2), Dharmamurthi Nagar, Pattabiram, Chennai-600072.

THREE TYPES OF LOOPS:

- **While loop:**
- Used for executing a set of statements repeatedly.
- The condition is tested at the beginning before entering the loop.
- **For loop:**
- It executes a set of statements number of times.
- Here , the variable initialisation , conditional statement and the variable incrementation all takes place in a single line.
- **do...While loop:**
- It executes like a while loop except that the condition is tested at the end.

THREE TYPES OF LOOPS:

- While loop
- public class WhileExample {
- public static void main(String[] args) {
- int i=1;
- while(i<=10){
- System.out.println(i);
- i++;
- }
- }
- }

Decision Making:

- When a statement needs to be executed based on a condition, then if statement is used and else block will be executed when the condition is false.
- There are four types of conditional statements:
- **if statement:** First , as the program flows, the condition will be tested and then a statement or group of statements will be executed.
- **if-else statement:** The program checks for the condition.
